Transcript for slide 9.

After writing your TA an instructional strategy needs to be selected. First, plan for generalization by working on presenting common stimuli and train across multiple exemplars. For example, when using a task analysis for teaching a student to wash hands, identify all possible sinks the student might come across and all the responses that would be required based on the type of sink. Also, train in the natural environment when possible. Use a chaining procedure, which will be discussed in more detail to come. Also use a prompting strategy and then decide between group or individual instruction.
